

All submitted works shall be considered property of AWS Learning Club - UST. For questions and concerns, please contact us through neilalfonz.casas.cics@ust.edu.ph, or by responding to our email thread.

DEVELOPMENT COMMITTEE

As a developer, you are in-charge of creating the visual and interactive elements that allow users to be engaged with the organization's virtual spaces, while also overseeing the server-side logic of the web application. You must have an eye for proper design and know how to convert the designs into working code.

You will be engaged in writing CSS, JavaScript, and other related web technologies, maintaining and managing the website to ensure that everything is in working order. You must be familiar with various web optimizations, security, technologies, and database management.

Bonus points if you are experienced with other frameworks such as NextJS, AngularJS, React, and so much more.

HOW TO SUBMIT

1. The deadline for submission is seven (7) days after you have received this exam.
2. Put your files in a .rar or .zip file
 - a. This compressed file may include your source codes, database, media files and assets, along with other resources needed. **Please do not include vendor files (composer / node_modules).**
3. Make sure you pass a working website! If the file is too large, upload it to a file hosting site like Google Drive, making sure that UST accounts can view the file.
4. Submit the link of the uploaded file in the original email thread. Kindly indicate the language/s and software you've used to create the application and if you used a framework as well.

Take the Challenge!

Create a blog style application that contains the following:

1. Create a Post - This allows the user to create their own post. Each post must have a title and a description
2. View All Posts - This will show all the posts that were created
3. View Single Post - This allows the user to view a single post from all the posts that were created.
4. Add Comment - This allows the user to add a comment to a post. When viewing only a single post, the comments made to that post must be seen as well.
5. Delete Comment - This allows the user to delete comments made on their post

Use as many resources/frameworks as you need like React, jQuery, Bootstrap, etc. but you are **not allowed to use a template**, even for components (i.e., headers, footers, shadcn, etc.).

Thank you and best of luck!
